Introduction

ES Lab is a multi-disciplinary design and consultancy firm providing consultancy, geotechnical investigation, laboratory testing, survey works and so on to individual and corporate clients. Our aim is to provide services to our client maintaining highest quality.

Our technical experts deliver sustainable solutions that cover the entire project life cycle from planning and design, through to delivery and management, as well as decommissioning and closure. We provide a full suite of multidisciplinary consultancy services across a diverse range of sectors. Through our integrated data acquisition, analysis and advice, we unlock insights from Geo-data to help you design, build and operate assets in a safe, sustainable and efficient manner.

We are focused on providing our clients with the best solutions for their challenges, no matter the scale or type of project. We pride ourselves on our responsive, pragmatic approach, which enables us to assist clients at any and every project stage. We understand the needs of our clients and can identify opportunities which others cannot. Together, we can deliver better outcomes.

Scopes of Services

ES LAB provides the following services:

Soil Test:

- 1) Field Data Collection**
 - a) Standard Penetration Test (SPT)
 - i) Percussion (Manual)
 - ii) Hydraulic Rotary Drilling
 - b) Undisturbed sample collection
 - i) Shelby Tube
 - ii) Piston Sampler
- 2) Laboratory Test**
 - a) Consolidation Test
 - b) Direct Shear Test
 - c) Unconfined Compression Test
 - d) Natural Moisture Content Test
 - e) Unit Weight/ Bulk Density & Void Ratio
 - f) Grain size Analysis
 - g) Atterberg/ Consistency Limit Test
 - h) Determination of Specific Gravity
 - i) Proctor Compaction Test
 - j) Field Density (Sand Cone Method)

Load Test:

- 1) Plate Load Test**
- 2) Pile Load Test**
- 3) Pile Integrity Test (PIT)**
- 4) Parallel Seismic Test (PSI)**

Surveying:

- 1) Digital Topographical Survey**
- 2) Digital Layout Survey**
- 3) Contour Survey**
- 4) Volume Calculation Survey**
- 5) Mouza Map Preparation**
- 6) River Survey**

DT and NDT:

- 1) Detail Ferro-Scanning**
- 2) Core Cutting & Testing**
- 3) Rebar Cutting & Testing**
- 4) Steel Plate Cutting & Testing**
- 5) Ultrasonic pulse velocity (UPV)**

List of Equipment Owned by ES Lab

Soil Testing Equipment:

1. Consolidation Testing Machine – 8 Nos
2. Direct Shear Test Apparatus – 1 Nos
3. Hydrometer – 2 Nos
4. Cylinder – 12 Nos
5. Unconfined Compression Test Apparatus – 1 Nos
6. Mechanical Sieve Shaker with Accessories – 1 Nos
7. Pycnometer – 10 Nos
8. Digital Balance with Accessories – 4 Nos
9. Undisturbed Sample Remover – 1 Nos
10. Vernier Calipers – 4 Nos
11. Thermometer – 2 Nos
12. Pipette or Dropper – 5 Nos
13. Stop Watch – 20 Nos
14. Oven – 1 Nos
15. Casagrande Apparatus – 4 Nos
16. Compaction Mold & Hammer – 2 Nos
17. Permeability test equipment – 1 Nos
18. CBR test equipment – 1 Nos
19. Field Density Equipment – 1 Nos
20. Dynamic Cone Penetrator (DCP) – 1 Nos

Surveying Equipment:

1. RTK Machine (Model- KTS-440 R10)
2. Total Station (Model-Sokkia CX-105, Leica TS06 Plus)
3. Alidade
4. Alidade table
5. Plane table
6. Dumpy level
7. Tape (surveying)
8. Measuring tape
9. Pole (surveying)
10. Surveyor's chain
11. Engineer's chain
12. Level staff
13. Ramsden surveying instruments
14. Ranging rod
15. Prism (surveying) (corner cube retroreflector)
16. Tripod (surveying)
17. Prismatic compass (angle measurement)
18. Land Demarcation Instrument

Load Testing Equipment:

1. Eco Sounding – 1 Nos
2. Pile Integrity Tester (PIT) – 1 Nos
3. Parallel Seismic Instrument (PSI) – 1 Nos
4. Pulse Measuring Machine – 1 Nos
5. Schmidth Hammer – 2 Nos
6. Plate Load Tester – 1 Set
7. Static Load Testing Equipment – 1 Set
8. Dynamic Load Testing Equipment – 1 Set

DT and NDT Equipment:

1. Laser Distance – 2 Nos
2. Core Cutter – 2 Nos
3. Ferro- Scanner – 2 Nos
4. UPV – 2 Nos

Work Methodology

Standard Penetration Test

The standard penetration test is an in-situ test that is coming under the category of penetrometer tests. The standard penetration tests are carried out to determine the engineering properties of subsurface soil. The test is extremely useful for determining the bearing capacity, density, and angle of shearing resistance of any soil. It can be used to determine the angle of internal friction or angle of shearing resistance of cohesionless soil and unconfined compressive strength of cohesive soil. The main purpose of this test is to identify the type and nature of the soil and to determine penetration resistance of soil at various depths which can be used for geotechnical design purposes.

Standard: ASTM D 1586

Performing SPT
using Rotary Rig

Collection of
Soil Sample

SPT Using
Manual Rig with
Auto Hammer

Moisture Content Determination

Moisture or Water Content (of a material) the ratio expressed as a percent of the mass of “pore” or “free” water in a given mass of material to the mass of the solid material. A standard temperature of $110^{\circ}\pm 5^{\circ}\text{C}$ is used to determine these masses.

Standard: ASTM D 2216

Oven

Performing Moisture Content

Wet Sieve Analysis

These test methods cover determination of the amount of material finer than a 75- μm (No. 200) sieve by washing.

Standard: ASTM D 1140

Wash Sieve

Sieve Analysis

Sieve analysis is a determination of the proportions of particles lying within certain size ranges in a granular material by separation on sieves of different size openings. This test method is used to separate particles into size ranges and to determine quantitatively the mass of particles in each range. These data are combined to determine the particle-size distribution (gradation). This test

method uses a square opening sieve criterion in determining the gradation of soil between the 3-in. (75-mm) and No. 200 (75- μ m) sieves. The gradation of a soil is an indicator of engineering properties.

Standard: ASTM D 422

Sieve Shaker

Sieve Set

Hydrometer Analysis

The sedimentation or hydrometer method is used to determine the particle-size distribution (gradation) of the material that is finer than the No. 200 (75- μ m) sieve and larger than about 0.2- μ m. The test is performed on material passing the No. 10 (2.0-mm) or finer sieve and the results are presented as the mass percent finer versus the log of the particle diameter.

Standard: ASTM D 422

Performing Hydrometer Test

Hydrometer
-152H

Hydrometer Cylinder

Atterb

Liquid limit (LL)— The liquid limit is determined by performing trials in which a portion of the specimen is spread in a brass cup, divided in two by a grooving tool, and then allowed to flow together from the shocks caused by repeatedly dropping the cup in a standard mechanical device.

Plastic limit (PL)—The plastic limit is determined by alternately pressing together and rolling into a 3.2-mm (1/8-in.) diameter thread a small portion of plastic soil until its water content is reduced to a point at which the thread crumbles and can no longer be pressed together and re-rolled. The water content of the soil at this point is reported as the plastic limit.

Standard: ASTM D 4318

Casagrande Apparatus

Performing Atterberg
Limit Test

Direct Shear Test

This test method covers the determination of the consolidated drained shear strength of one specimen of a soil material under direct shear boundary conditions. The specimen is deformed at a controlled rate on or near a single shear plane determined by the configuration of the apparatus.

Standard: ASTM D 3080

Direct Shear Apparatus

Performing Direct Shear test

Unconfined Compression Test

In this test method, a cylindrical soil specimen is unconfined laterally while loaded axially at an axial strain rate between 0.5 to 2 %/min. Measurements are made of elapsed time, axial deformation, and axial load. The unconfined compressive stress, q_u , is calculated as the compressive stress at failure. The shear strength, s_u , is one half of the unconfined compressive strength.

Standard: ASTM D 2166

Unconfined Compression Test Apparatus

One Dimensional Consolidation Test

The gradual reduction in volume of a soil mass resulting from an increase in compressive stress. These test methods cover procedures for determining the magnitude and rate of consolidation of soil when it's restrained laterally and drained axially while subjected to incrementally applied controlled-stress loading. Time deformation readings are taken throughout an increment, the rate of consolidation is evaluated with the coefficient of consolidation.

Standard: ASTM D 2435

Performing Consolidation Test

Odometer with Weight Set

Determination of Specific Gravity

The ratio of the mass of a unit volume of a soil solids to the mass of the same volume of gas-free distilled water at 20°C.

These test methods cover the determination of the specific gravity of soil solids that pass the 4.75-mm (No. 4) sieve, by means of a water pycnometer.

Standard: ASTM D 854

Pycnometer used in Specific Gravity Determination

Plate Load Test

Plate load tests provide a direct measure of load bearing capacity (strength), as well as deformation under load.

The load carrying capacity and extent to which a soil undergoes settlement under a given load must be known beforehand in order to design a foundation for the structures. In the field the ultimate bearing capacity and corresponding settlements can be determined with the help of plate load tests.

Standard: BS 1377 Part 9: 1990

Plate Load Test

Pile Load Test

Static pile load testing is one of the most common methods for testing the actual in-situ capacity of a pile.

The test procedure is based on the direct measurement of pile head displacement in response to a physically applied load. The test pile is loaded using a calibrated hydraulic jack that applies the test load to the pile by pushing against a beam placed directly over the test pile. The test beam is restrained by an anchorage system consisting of reaction piles installed in the ground to provide tension resistance. Once the load test frame is installed and fully instrumented, the hydraulic jack applies the test load in a series of increments according to the testing requirements as per project specifications. Each load is held for a certain amount of time until either twice the design load or pile failure is reached, whichever comes first. Pile movement is recorded with each incremental load.

Standard: ASTM D 1143

Pile Integrity Test (PIT)

PIT is a widely used non-destructive test method for the evaluation of pile quality, and integrity. The test can also be used to estimate the unknown length of existing piles and foundations. In the low strain impact integrity testing, the response of the pile to an impact on the head of the pile shaft is determined by a high precision transducer mounted on the pile head. The transducer can either be an accelerometer, or a velocity sensor. The test standard allows two different procedures to obtain acceleration and force information: 1) Pulse-Echo Method (PEM) or Sonic-Echo (SE) and 2) The Transient Response or Impulse-Response (IR).

Standard: ASTM D 5882

Performing PIT

Pile Integrity Tester

Parallel Seismic Test (PSI)

Parallel Seismic is more accurate, more versatile than other nondestructive surface techniques for determination of unknown foundation depths.

Parallel Seismic (PS) systems are designed to determine the length and integrity of foundations when the top is not accessible or when the pile is too long and slender to test with echo techniques, or below a buried pile cap. Ultimately, Parallel Seismic testing provides information concerning the length and compressional velocity of foundations and can be used on concrete, wood, masonry, and steel foundations. This method also provides information about the soil below the foundation bottom.

Standard: ASTM D 5882-07

Performing PSI

Ultrasonic Pulse Velocity (UPV) Test

Ultrasonic Pulse Velocity Tester is used to measure the velocity of propagation of ultrasonic pulses through concrete. A pulse of longitudinal vibrations is produced by an electro-acoustical transducer held in contact with one surface of the concrete under test. After traversing a known path length in the concrete, the pulse of vibrations is converted into an electrical signal by a second transducer and electronic timing circuits enable the transit time of the pulse to be measured.

BS EN 12504-4:2004 gives guidance on testing fresh concrete, hardened concrete and concrete in structures. It specifies a method for the determination of the velocity of propagation of pulses of ultrasonic longitudinal waves in concrete.

The measurement of pulse velocity can be used for the determination of the uniformity of concrete, the presence of cracks or voids, changes in properties with time and in the determination of dynamic physical properties.

Standard: ASTM C 597-09

TRANSDUCER ARRANGEMENT

Three transducer arrangements are commonly used.

Wherever possible use the direct arrangement as this ensures the maximum signal transmission between the transducers. The semi-direct arrangement is less sensitive than the direct, but more sensitive than the indirect arrangement. The path length is the distance between the centers of each transducer.

The indirect method is particularly useful for determining crack depth, surface quality or in the case when only one surface is accessible.

WORK METHODOLOGY

- It will be verified at first that the equipment is operating properly and a zero-time adjustment will be performed.
- Coupling agent will be applied to the transducer faces and the faces will be pressed together. The instrument uses a microprocessor to record this delay time, which is subtracted automatically from subsequent transit time measurements.
- Coupling agent will be applied to the ends of the reference bar, and the transducers will be pressed firmly against the ends of the bar until a stable transit time is displayed. The zero reference will be adjusted until the displayed transit time agrees with the value marked on the bar.
- The zero adjustment will be checked on an hourly basis during continuous operation of the instrument, and every time a transducer or connecting cable is changed.
- For testing existing construction, test locations will be selected in accordance with Practice C823, or by the requirement from client's end.
- Appropriate coupling agent will be applied (such as water, oil, petroleum jelly, grease, moldable rubber, or other viscous materials) to the transducer faces or the test surface, or both. The faces of the transducers will be pressed firmly against the surfaces of the concrete until a stable transit time is displayed, and the transit time will be measured. The straight-line distance between centers of transducer faces will be measured.

Technical Specification of Apparatus:

Pundit PL-200

Pundit PL-200 – The new Benchmark for Ultrasonic Pulse Velocity Testing

Best-in-class Ultrasonic testing instrument providing superior features for on-site testing:

- ✓ Line Scans and Area Scans for concrete uniformity assessment
- ✓ Zoom and scroll for precise A-Scan inspection
- ✓ On board storage and review of waveforms
- ✓ Settings directly accessible on measuring screen
- ✓ Dual cursor for manual A-Scan evaluation
- ✓ Separate cursor to measure signal amplitude
- ✓ Improved surface velocity measurement
- ✓ Automatic and manual triggering and user adjustable trigger threshold
- ✓ A-Scan update rate up to 40 Hz
- ✓ Expandable with Pundit Pulse Echo transducer

Technical Specification

	Pundit PL-200	Pundit PL-200PE
Range	0.1 – 7930 μ s	
Resolution	0.1 μ s (< 793 μ s), 1 μ s (> 793 μ s)	
Display	7" colour display 800x480 pixels	
Pulse Voltage	UPV	100 – 450 Vpp
	UPE	– 100 – 400 Vpp
Bandwidth	20 – 500 kHz	
Receiver Gain	1x – 10'000x (0 – 80dB) [11 steps]	
Memory	Internal 8 GB Flash memory	
Regional Settings	Metric and imperial units and multi-language supported	
Battery	Lithium Polymer, 3.6 V, 14.0 Ah	
Battery Lifetime	> 8h (in standard operating mode)	
Operating Temperature	0°C – 30°C (Charging, running instrument) 0°C – 40°C (Charging, instrument is off) -10°C – 50°C (Non-charging)	
Humidity	< 95 % RH, non condensing	
IP Classification	IP54	

Pundit Lab⁺

Transit time Measurement	
Range	0.1 – 9999 μ s Auto ranging.
Resolution	0.1 μ s
Display	
79 x 21 mm passive matrix OLED	
Transmitter	
Optimized energizing pulse 125 V, 250 V, 350 V, 500 V, AUTO	
Receiver	
Selectable gain steps Pundit Lab	1x, 10x, 100x, AUTO
Selectable gain steps Pundit Lab ⁺	1x, 2x, 5x, 10x, 20x, 50x, 100x, 200x, 500x, 1000x, AUTO
Bandwidth	20 kHz – 500 kHz
Memory	
Non volatile, > 500 measured values	
Regional Settings	
Metric and imperial units supported	
Power Supply	
Battery	4 x AA batteries (> 20 hours continuous use)
Mains:	5v, <500mA via USB Charger
PC	5v, <500mA directly via USB cable
Mechanical	
Dimensions	172 x 55 x 220 mm
Weight	1.3 kg (incl. batteries)
Environmental conditions	
Operating temperature	-10° to 60°C (0° to 140°F)
Humidity	<95% RH, non condensing
IP Classification	IP42

CALCULATION

$$V = L/T$$

Where,

V = pulse velocity, m/s

L = distance between centers of transducer faces, m

T = transit time, s.

Schmidt Hammer Test or Rebound Hammer Test

Rebound hammer test method is based on the principle that the rebound of an elastic mass depends on the hardness of the concrete surface against which the mass strikes. The operation of the rebound hammer is shown in figure-1. When the plunger of rebound hammer is pressed against the concrete surface, the spring-controlled mass in the hammer rebounds. The amount of rebound of the mass depends on the hardness of concrete surface. Thus, the hardness of concrete and rebound hammer reading can be correlated with compressive strength of concrete. The rebound value is read off along a graduated scale and is designated as the rebound number or rebound index. The compressive strength can be read directly from the graph provided on the body of the hammer.

Standard: ASTM C 805

Schmidt Hammer

Performing Schmidt Hammer

Digital Topographic Survey

ES Lab is recognized as one of the top digital land surveying firms in Bangladesh. ES Lab provides Surveying and Land Planning services for the development of private and public projects. ES Lab has helped hundreds of clients to maximize the value of their projects by finding potential opportunities.

Qualified engineers and skilled technicians were employed to compete with multinationals in terms of rate and quality. We can boldly say that our company achieved the firm due to the countless efforts of our employees. We also believe that our success depends on the experience and sincere efforts of our technical personnel and inspired collective management. Quality and accuracy of work are possible as we have sufficient modern equipment by which we can satisfy our clients.

Our range of services is inclusive of Topographical surveys, Geographical surveys, Hydrographical surveys, GPS & GNSS, Repairing & Maintenance, Lab Activities, Contour Survey, Volume Calculation Survey, Mouza Map Preparation. There is a great demand for these in varied kinds of project management requirements and civil and structural engineering. Our services are renowned for being prompt, relevant, effective and accurate. In our field operations, we use cutting edge technologies and all of the latest office processing and CAD software.

At ES Lab, we understand that it is the little things that make a big difference in your projects. Over the years, our clients have come to know and trust us for our consistent and thorough approach and also our dedication as a project partner. We are committed to help you building a successful project.

Total Station

Performing Digital Survey

Ferro Scanning

The Ferro scan test is a non-destructive testing (NDT) method used to locate and map reinforcing bars in concrete. It is a rapid and accurate method that can be used to assess the condition of existing concrete structures, identify potential defects, and plan repairs or renovations.

With Ferro Scanning we know where to drill, core, saw and cut in concrete structures on site helps to avoid costly repairs, saves time, prevents accidents and protects tools, drill bits and inserts.

Using specialist equipment we scan, detect and mark the position and depth of the rebar within concrete structures.

The marked positions can then be surveyed using a total station enabling drawings showing positions and depths to be produced. The information can be related to site grid.

PS300 Ferro-Scanner

Performing Ferro Scanning

WORK METHODOLOGY

The Ferro scan test method uses a handheld scanner that emits a magnetic field. The scanner is passed over the concrete surface, and the magnetic field induces an eddy current in the reinforcing bars. The eddy current, in turn, generates a secondary magnetic field that is detected by the scanner. The strength and shape of the secondary magnetic field are used to determine the location, depth, and diameter of the reinforcing bars.

- The concrete surface should be clean, dry, and free of debris. Any surface irregularities, such as cracks or spalling, should be repaired.
- The scanner will be calibrated before each use (Figure-01). This ensures that the scanner is measuring the magnetic field accurately.

- The scanner will be placed on the concrete surface and will be hold firmly against the surface. The scanner should be oriented so that the magnetic field is perpendicular to the reinforcing bars.
- The scanner will be moved slowly and evenly over the concrete surface. The scanner will collect data on the location, depth, and diameter of the reinforcing bars. Movement of the scanner will be detected by Hilti Detection (Figure-2).

Figure 2

- The data collected by the scanner can be used to generate a map of the reinforcing bars in the concrete. This map can be used to assess the condition of the concrete, identify potential defects, and plan repairs or renovations. Sample of Scanning Path is attached in Figure-03.

Figure 3

TECHNICAL SPECIFICATION OF APPARATUS:

	PS 300
Maximum depth for measurement of coverage	200 mm (7.9 in)
Accuracy of localization	1 % +/- 3 mm (0.12 in)
Accuracy of cover measurement to a depth $\leq$ 50 mm (1.97 in).	+/- 1 mm (0.04 in)
Rebar diameter	4 mm ... 57 mm (0.2 in ... 2.2 in)
Battery life under normal operating conditions	4 h
Maximum scanning speed	0.50 m/s (1.64 ft/s)
Memory type	Built-in flash memory
Memory capacity	3 GB
Data interface	USB
Data transfer rate	Typically 4 Mbyte/s
Weight	1.95 kg (4.30 lb)
Dimensions	284 x 163 x 154 mm (11.18 x 6.42 x 6.06 in)
Display type	LCD
Display size	134.8 x 90.6 mm (5.31 x 3.57 in)
Display resolution	800 x 480 pixels
Degree of protection, without battery	IP 54
Relative air humidity	90 %
Ambient temperature for operation	-10 °C ... 50 °C (14 °F ... 122 °F)
Storage temperature	-25 °C ... 63 °C (-13 °F ... 145 °F)

Terms and Conditions

1. Vendor/contractor shall acknowledge this order promptly and such acknowledgement shall be deemed as an acceptance to the terms and conditions thereof.
2. No substitution, alteration, change in price, quantity or variation in quantity & quality of any items called for, can be made by vendor/contractor in this order unless agreed mutually in writing.
3. Vendor cannot copy, use or hand over the company's Logo to any other persons/firms unless agreed mutually in writing.
4. Vendor/contractor guarantees that at the time of delivery thereof the articles covered by this order will be free from any defects in materials, workmanship & conform to their requirements of this order.
5. Supply of any required items including mobilization of man & machinery should be arranged by vendor/contractor at their own cost strictly in accordance with Coats specification. They should also comply with instruction of competent authority of Coats Bangladesh Ltd (#The Company#).
6. Supply of any required items or commencement of works should be made on receipt of firm order and be completed within the stipulated time from the date of commencement of work without any delay.
7. Work of any nature should be carried out without damaging any existing structure/fittings. Any such damages or disconnection should be set right by the vendor/contractor concerned at their own cost.
8. If the contractor fails to rectify the defects/damages and to complete the job within stipulated time without any valid reason which has been agreed with the Company, then the Company shall reserve the right to deduct the same from the retained security money/payment invoices.
9. The contractor shall abide by all the laws of the Country, Coats policies, Coats Supplier Code. No child labor under the age of 18 (eighteen) years is allowed to be engaged by the contractor directly or indirectly for any of our works & services. In relation to child labour age, the purchase order terms take priority over the Coats Supplier Code. If either party breaches the anti-corruption and HR clauses in the Coats Supplier Code, or otherwise acts in contravention of anti-corruption legislation or human rights law, then the other party shall have the right to terminate this purchase order without notice and with immediate effect.
10. In case of supply of goods, the vendor/contractor shall provide quality certificate/safety where applicable.
11. Any required work is to be carried out without hampering the normal production or operation of Company. In the case prior permission for working on holidays may be obtained from the concerned authority.
12. Advance or Progress payment is not allowed but this may be considered in some emergency or unavoidable cases subject to approval of competent authority as agreed between the Parties in writing.
13. Payment on approved bill or invoice will be made through A/C Payee Cheque/Bank Transfer after agreed payment terms from the date of receipt of correct bill/invoice by our Chittagong/Dhaka Finance Department. In the case of Engineering job, a #Job Completion Certificate# obtaining from the Engineering Incharge/consultant (as applicable) should be submitted along with the bill/invoice.
14. Payment against Letter of Credit will be made on agreed Payment Terms in negotiated currency convertibility at the prevailing rate (in the case of foreign currency) for supply as per L/C terms and conditions.
15. VAT, Levi & Income Tax as applicable from time to time, will be deducted from the Contractor's bill as per relevant laws of the country.
16. The management of the Company reserves the right to cancel the purchase order and to alter, change or amend, reject any of the conditions thereof partially or wholly at any stage without assigning any reasons whatsoever.
17. In case of any dispute, confusion or ambiguity in any issue or terms & conditions related to the work, service, supply agreement and purchase order, the decision of the management of Coats Bangladesh Ltd. is final without any prejudice.
18. Force Majeure Event" : A # Force Majeure Event" means an event the occurrence of which is beyond the reasonable control of either party, including an Act of God, national viruses, epidemics and pandemics (both as defined by the World Health Organisation), government intervention, war, explosions, fires, floods, tempests, earthquake, insurrection, acts of terrorism, riot, civil disturbance, rebellion, strike, lock-out or labour dispute but not a strike, lock-out or labour dispute involving the Customer. If either party is affected by # Force Majeure Event it shall as soon as reasonably practicable and without undue delay notify the other party of the nature and extent of the event. If a # Force Majeure Event prevents a party (the "Affected Party") from performing any of its obligations to the other (the "Other Party") the Affected Party shall not be liable to the Other Party and shall be released from its obligations to the extent that its ability to perform such obligations has been affected by the # Force Majeure Event. If the impact of the # Force Majeure Event upon the Affected Party prevents it from performing a substantial part of its obligations under this Agreement for a period of 60 consecutive days, the Other Party may, by giving no less than 30 days# written notice, terminate this Agreement either in whole or in part, without liability to the Affected Party.
19. Subject to the terms hereof, vendor and all its employees will maintain as confidential all information provided to it by the Company and will use such information only for the purposes set out in this purchase order and for no other purposes whatsoever.
20. The relevant tender notice, subsequent addendums, amendments/corrigendum (if any) will be the part of this terms & conditions.

Terms and Conditions

1. Vendor/contractor shall acknowledge this order promptly and such acknowledgement shall be deemed as an acceptance to the terms and conditions thereof.
2. No substitution, alteration, change in price, quantity or variation in quantity & quality of any items called for, can be made by vendor/contractor in this order unless agreed mutually in writing.
3. Vendor cannot copy, use or hand over the company's Logo to any other persons/firms unless agreed mutually in writing.
4. Vendor/contractor guarantees that at the time of delivery thereof the articles covered by this order will be free from any defects in materials, workmanship & conform to their requirements of this order.
5. Supply of any required items including mobilization of man & machinery should be arranged by vendor/contractor at their own cost strictly in accordance with Coats specification. They should also comply with instruction of competent authority of Coats Bangladesh Ltd (#The Company#).
6. Supply of any required items or commencement of works should be made on receipt of firm order and be completed within the stipulated time from the date of commencement of work without any delay.
7. Work of any nature should be carried out without damaging any existing structure/fittings. Any such damages or disconnection should be set right by the vendor/contractor concerned at their own cost.
8. If the contractor fails to rectify the defects/damages and to complete the job within stipulated time without any valid reason which has been agreed with the Company, then the Company shall reserve the right to deduct the same from the retained security money/payment invoices.
9. The contractor shall abide by all the laws of the Country, Coats policies, Coats Supplier Code. No child labor under the age of 18 (eighteen) years is allowed to be engaged by the contractor directly or indirectly for any of our works & services. In relation to child labour age, the purchase order terms take priority over the Coats Supplier Code. If either party breaches the anti-corruption and HR clauses in the Coats Supplier Code, or otherwise acts in contravention of anti-corruption legislation or human rights law, then the other party shall have the right to terminate this purchase order without notice and with immediate effect.
10. In case of supply of goods, the vendor/contractor shall provide quality certificate/safety where applicable.
11. Any required work is to be carried out without hampering the normal production or operation of Company. In the case prior permission for working on holidays may be obtained from the concerned authority.
12. Advance or Progress payment is not allowed but this may be considered in some emergency or unavoidable cases subject to approval of competent authority as agreed between the Parties in writing.
13. Payment on approved bill or invoice will be made through A/C Payee Cheque/Bank Transfer after agreed payment terms from the date of receipt of correct bill/invoice by our Chittagong/Dhaka Finance Department. In the case of Engineering job, a #Job Completion Certificate# obtaining from the Engineering Incharge/consultant (as applicable) should be submitted along with the bill/invoice.
14. Payment against Letter of Credit will be made on agreed Payment Terms in negotiated currency convertibility at the prevailing rate (in the case of foreign currency) for supply as per L/C terms and conditions.
15. VAT, Levi & Income Tax as applicable from time to time, will be deducted from the Contractor's bill as per relevant laws of the country.
16. The management of the Company reserves the right to cancel the purchase order and to alter, change or amend, reject any of the conditions thereof partially or wholly at any stage without assigning any reasons whatsoever.
17. In case of any dispute, confusion or ambiguity in any issue or terms & conditions related to the work, service, supply agreement and purchase order, the decision of the management of Coats Bangladesh Ltd. is final without any prejudice.
18. Force Majeure Event" : A # Force Majeure Event" means an event the occurrence of which is beyond the reasonable control of either party, including an Act of God, national viruses, epidemics and pandemics (both as defined by the World Health Organisation), government intervention, war, explosions, fires, floods, tempests, earthquake, insurrection, acts of terrorism, riot, civil disturbance, rebellion, strike, lock-out or labour dispute but not a strike, lock-out or labour dispute involving the Customer. If either party is affected by # Force Majeure Event it shall as soon as reasonably practicable and without undue delay notify the other party of the nature and extent of the event. If a # Force Majeure Event prevents a party (the "Affected Party") from performing any of its obligations to the other (the "Other Party") the Affected Party shall not be liable to the Other Party and shall be released from its obligations to the extent that its ability to perform such obligations has been affected by the # Force Majeure Event. If the impact of the # Force Majeure Event upon the Affected Party prevents it from performing a substantial part of its obligations under this Agreement for a period of 60 consecutive days, the Other Party may, by giving no less than 30 days# written notice, terminate this Agreement either in whole or in part, without liability to the Affected Party.
19. Subject to the terms hereof, vendor and all its employees will maintain as confidential all information provided to it by the Company and will use such information only for the purposes set out in this purchase order and for no other purposes whatsoever.
20. The relevant tender notice, subsequent addendums, amendments/corrigendum (if any) will be the part of this terms & conditions.
